Data Set Description:

The Monthly Gridded Radiative Fluxes and Clouds (FSW) archival data product contains hourly single satellite flux and cloud parameters averaged over 1.0-degree regions. Input to the FSW Subsystem is the Clouds and Radiative Swath (CRS) archival data product. Each FSW covers a single month swath from a single CERES instrument mounted on one satellite. The product is written in HDF and contains metadata as well as gridded science data. For TRMM, data is organized onto eight HDF files, each containing data for 10 1.0-degree equal-angle zones. For Terra and Aqua, data is organized onto 60 HDF files, each containing data for three 1.0-degree equal-angle zones. The science data are SDSs with multiple records. Each record contains spatially averaged data for an individual region.

The FSW product includes:
- Time and Position Data
- Regional Identification Data
- Surface Map and Full-Clear area Data
- Imager Radiances Statistics
- Angular Model Scene Type
- TOA Fluxes (mean std num_obs)
- Pristine Vertical Flux Profiles
- Constrained Clear Sky Profiles
- Constrained Total Sky Profiles
- Constraint - Initial Flux Deltas
- Surface Emissivity
- Cloud Overlap Conditions
- Cloud Layer - High (mean std num_obs)
- Cloud Layer - UpperMid (mean std num_obs)
- Cloud Layer - LowerMid (mean std num_obs)
- Cloud Layer - Low (mean std num_obs)
- Constraint - Adjustments
- MODIS land aerosols (Starting with Edition2A Terra, not available for TRMM)
- MODIS ocean aerosols (Starting with Edition2A Terra, not available for TRMM)
- Cloudy Skies With No Aerosols (Starting with Edition2A Terra, not available for TRMM)

Only footprints with imager coverage are included. Therefore, CERES footprints which fall outside of the imager swath do not appear on the FSW product. The maximum VIRS viewing zenith angle is ~48°, and the maximum MODIS viewing zenith angle is ~65°.

Additional information about the format and content of the FSW can be found in the CERES Data Products Catalog. A detailed description of the FSW will be found in the FSW Collection Guide.

Summary of Changes:
The CERES Data Management Team and the Atmospheric Science Data Center (ASDC) at Langley use a Sampling Strategy, a Production Strategy, and a Configuration Code (CCode) to track versions of CERES primary data products. In general, minor reprocessing changes are tracked by increasing the Configuration Code while major reprocessing changes result in a new Production Strategy. The Sampling Strategy identifies the satellite and instruments which acquired the data in the product.

A summary of changes made to the CERES FSW product is shown in the following tables.

- Edition2A CRS and DAO-GEOS4 PMOA are used as inputs.
- Julian Time is written as 8-byte REAL on FSW HDF product. (SDS 1)
- SDSs for Cloudy Skies with no Aerosols are added to FSW product. (SDSs 253 - 273)
- Overlap hours (last 12 hours of the previous month and the first 12 hours of the following month) data is written onto the FSW product. The overlap hours are indicated as negative numbers on the records.
- Selection of TRMM ADM SW type is implemented in the TOA flux averaging process since the input product contained Terra ADMs on the records. TRMM sw adm types for unknown type is set to 591, Clear Sky snow is set to 593. (SDS 30)
- Beta5 CRS and ECMWF-GEOS3 PMOA are used as inputs.
- Snow/Ice percent (SDS 13) for Clear sky area is calculated for each footprint using snow/ice, clear-area input values. The input snow/ice data is the percent of the entire footprint that is clear snow. TISA calculates the percent of the clear area. Admgeo parameter data from CRS is averaged and...
### Cloud Layer Properties on each footprint are weighted by the area cloud fraction before its mean values are calculated.

- Beta3 CRS and ECMWF-GEOS3 PMOA are used as inputs.
- MODIS Land Aerosols (SDS 243 - 245) are added to FSW product.
- MODIS Ocean Aerosols (SDS 246 - 252) are added to FSW product.
- FSW HDF product is written in compressed format.

The requested form of acknowledgment for any publication in which these data are used is:

“These data were obtained from the NASA Langley Research Center Atmospheric Science Data Center.”

The Langley Data Center requests a reprint of any published papers or reports or a brief description of other uses (e.g., posters, oral presentations, etc.) of data that we have distributed. This will help the Data Center determine the use of data distributed, which is helpful in optimizing product development. It also helps us to keep our product related references current.
