

DOE-ARM Water Vapour IOP '97 26 September 1997 AERI Validation Case

=====

\$Date: 1998/02/09 23:17:19 \$
\$Id: README,v 1.1 1998/02/09 23:17:19 paulv Exp \$
\$Log: README,v \$
Revision 1.1 1998/02/09 23:17:19 paulv
Initial revision

The file validation_case_970926.tar contains the AERI-00 and -01 measured radiances averaged from 0500-0700UTC, 970926 and best estimate atmospheric temperature and water vapour profiles from the DOE ARM WVIOP97 at the ARM CART SGP Central Facility, Lamont Oklahoma USA. Also included are PostScript files of plots of the measurements.

Any questions or comments about the data can be referred to:

NAST-I Brightness Temperature Spectra

Mid-Latitude Winter ; Zenith Angle = 45 Degree

NAST-I Preliminary Temperature Performance

2.5 times of spec. noise + 0.2K forward model error

NAST-I Preliminary Water Vapor Performance

2.5 times of spec. noise + 0.2K forward model error

Retrieval Temperature/Water Vapor Entropy Reduction

[ert.gif](#)

[erq.gif](#)

Note on Entropy Reduction

Entropy Reduction = Increase in Information

The increase in information is equated to the decrease in entropy (ENTROPY REDUCTION) resulting from the retrieval process using satellite measurements. In another words, the increase in information in a profile of temperature and water vapor due to the retrieval can be characterized in terms of the reduction of entropy from forecast error covariance (top left panel) to the retrieval error covariance (top right panel - GHIS ; bottom right panel - GOES).

An entropy reduction of X units represents a retrieval error which is half the forecast error in X independent pieces of information (or one quarter the forecast error in X/2 pieces on information, etc.) For example, a value of 6 for temperature profile is equivalent to halving of forecast error in 6 independent pieces of information; this can be interpreted as 6 atmospheric layers only if the correlations of error between these layers are negligible or are preserved in the retrieval process.

A value of about 1 unit in water vapor retrieval may represent a halving of error in the local column water vapor only, with no additional information on the profile.
